

RecallOps Cortex

Build brief for Arman · [Google Cloud Rapid Agent Hackathon](#) · [Fivetran track](#)

STATUS — Product built & verified. **openFDA + Gemini are LIVE**. 14 routes render clean, human-approval → **CONTAINED** → audit hash-chain verified. What's left is cloud provisioning — your tasks below.

What it is

An agent that turns a **real openFDA food recall** into a scoped blast radius, a Gemini-drafted containment plan, human approvals, and an audit-ready compliance report. Operational data syncs via **Fivetran** → **BigQuery**; **Gemini 3** reasons over it; every action is **human-approved** (nothing auto-executes) and written to a tamper-evident **sha256 audit chain**.

Your tasks (in order)

1 · Enable billing → unlock Gemini 3 (required model)

Gemini is already live on `gemini-2.5-flash`. **gemini-3-pro-preview** is verified available on the key, but the free-tier quota is 0 — billing is the only blocker (the \$300 trial covers it). GCP project: **681822930558**.

- Console → Billing → link a billing account.
- Then set `backend/.env` → `GEMINI_MODEL=gemini-3-pro-preview`, restart.
- Verify `POST /api/agent/run` returns `live: true` with the `gemini-3` model.

2 · BigQuery — real query job IDs

```
gcloud auth application-default login
bq --location=US mk -d 681822930558:recallops_cortex
python backend/scripts/load_bigquery.py # loads seed, prints job IDs
```

Confirm the printed stats match the UI: **1842** units · **312** sold · **37** locations · **284** customers. Then `/api/health` shows `bigquery: live`.

3 · Fivetran connector (partner-track requirement)

- `fivetran.com` → add one connector (a Google Sheet of the seed is quickest) → destination = BigQuery dataset `recallops_cortex`.
- API key/secret + group id → `backend/.env` (`FIVETRAN_API_KEY` / `SECRET` / `GROUP_ID`).
- `/fivetran` then shows real connector status + sync timestamps.

4 · Deploy + host

```
gcloud run deploy recallops-cortex-api \
  --source backend --region us-central1 --allow-unauthenticated
```

Put the printed URL in `index.html` → `window.R0_CONFIG.apiBase`. Host the static `cortex/` folder (Firebase / Vercel / Netlify) — that's the Devpost Project URL.

5 · Validate (the proof judges want)

- `python backend/scripts/smoke_test.py` → RESULT: PASS.
- `/api/health` → all integrations live.
- Capture: openFDA record id · BigQuery job IDs · Fivetran sync timestamps · Gemini 3 model + tokens.

Run it locally

```
python -m venv .venv
.venv/Scripts/python -m pip install -r backend/requirements.txt
.venv/Scripts/python -m uvicorn app.main:app --app-dir backend --port 8099
python -m http.server 8790          # second terminal → open http://127.0.0.1:8790
```

Repo & commits

Repo: github.com/SyedArmanAli2003/ResQNet. You have **Write** access — commit directly, no PRs needed. First push:

```
git add -A && git commit -m "... "
git branch -M main
git remote add origin https://github.com/SyedArmanAli2003/ResQNet.git
git push -u origin main
```

Full details: [docs/ARMAN.md](#) · [docs/setup.md](#) · [docs/SUBMISSION.md](#) (Devpost text + 3-min video script).

SECURITY — The Gemini key currently in `.env` was exposed in chat — **revoke it and generate a fresh one** before deploying or pushing publicly. Never commit `.env` (already in `.gitignore`).
